

# Three estimators of $\theta$

You should prefer the blue curve over the black curve.

How do we compare the blue and red curves?

# Three estimators of $\theta$

The smaller variance of the red distribution is not a measure of how close the estimator is to  $\theta$ .

# Definition

Let  $\hat{\theta}$  be an estimator of a parameter  $\theta$ .

The **mean squared error** of  $\hat{\theta}$  is denoted and defined by

$$\text{MSE}(\hat{\theta}) = E[\underbrace{(\hat{\theta} - \theta)}_{\text{error}}^2]$$

r.v.      its mean

Note: If  $\hat{\theta}$  is an unbiased estimator of  $\theta$ ,  
its mean squared error is simply the  
variance of  $\theta$ .

# Definition

Let  $\hat{\theta}$  be an estimator of a parameter  $\theta$ .

The **bias** of  $\hat{\theta}$  is denoted and defined by

$$B(\hat{\theta}) = E[\hat{\theta}] - \theta$$

An unbiased estimator has a bias of zero.

# Variance, MSE, and Bias

Let  $\hat{\theta}$  be an estimator of a parameter  $\theta$ .

$$\text{MSE}(\hat{\theta}) = E[(\hat{\theta} - \theta)^2]$$

$$= E[(\hat{\theta} - E[\hat{\theta}] + E[\hat{\theta}] - \theta)^2]$$

$$= E[(\hat{\theta} - E[\hat{\theta}]) + B[\hat{\theta}]]^2]$$

- $E[(\hat{\theta} - E[\hat{\theta}])^2] = \text{Var}[\hat{\theta}]$

# Variance, MSE, and Bias

Let  $\hat{\theta}$  be an estimator of a parameter  $\theta$ .

$$\text{MSE}(\hat{\theta}) = E[(\hat{\theta} - \theta)^2]$$

$$= E[(\hat{\theta} - E[\hat{\theta}] + E[\hat{\theta}] - \theta)^2]$$

$$= E[(\hat{\theta} - E[\hat{\theta}] + B[\hat{\theta}])^2]$$

- $2E[(\hat{\theta} - E[\hat{\theta}])B[\hat{\theta}]]$

$$E[\hat{\theta}] - E[E[\hat{\theta}]] = E[\hat{\theta}] - E[\hat{\theta}] = 0$$

# Variance, MSE, and Bias

Let  $\hat{\theta}$  be an estimator of a parameter  $\theta$ .

$$\text{MSE}(\hat{\theta}) = E[(\hat{\theta} - \theta)^2]$$

$$= E[(\hat{\theta} - E[\hat{\theta}] + E[\hat{\theta}] - \theta)^2]$$

$$= E[(\hat{\theta} - E[\hat{\theta}] + B[\hat{\theta}])^2]$$

- $E[(B[\hat{\theta}])^2] = (B[\hat{\theta}])^2$

# Variance, MSE, and Bias

Let  $\hat{\theta}$  be an estimator of a parameter  $\theta$ .

$$\text{MSE}(\hat{\theta}) = \text{Var}[\hat{\theta}] + (\text{B}[\hat{\theta}])^2$$

If you have multiple estimators of a parameter, at least one of which is biased, compare them using mean squared error!

# Relative Efficiency

Let  $\hat{\theta}_1$  and  $\hat{\theta}_2$  be two unbiased estimators of a parameter  $\theta$ .

$\hat{\theta}_1$  is **more efficient** than  $\hat{\theta}_2$  if

$$\text{Var}[\hat{\theta}_1] < \text{Var}[\hat{\theta}_2]$$

The **relative efficiency** of  $\hat{\theta}_1$ , relative to  $\hat{\theta}_2$  is denoted/defined as

$$\text{Eff}(\hat{\theta}_1, \hat{\theta}_2) = \frac{\text{Var}[\hat{\theta}_2]}{\text{Var}[\hat{\theta}_1]}$$

# Relative Efficiency

The **relative efficiency** of  $\hat{\theta}_1$ , relative to  $\hat{\theta}_2$  is denoted/defined as

$$\text{Eff}(\hat{\theta}_1, \hat{\theta}_2) = \frac{\text{Var}[\hat{\theta}_2]}{\text{Var}[\hat{\theta}_1]}$$

- $\text{Eff}(\hat{\theta}_1, \hat{\theta}_2) > 1$

$\Rightarrow \hat{\theta}_1$  is more “efficient” at estimating  $\theta$  than  $\hat{\theta}_2$
